

On April 20, while on a ramble, I discovered a Migrant Shrike's nest. The nest consisted of coarse grass lined with feathers, and was placed in a tall hedge about seven feet from the ground. When approached she would fly from the nest or perch on the nearby hedge or light on the ground in the distance, never ceasing to watch my every move. When I left the nest she would return immediately. Their favorite food (mice) was impaled all along the fence on the thorns. Though I visited the place frequently I saw only the female bird.

KATIE M. ROADS.

## Publications Reviewed

Observations on the Yellow-billed Tropic-Bird (*Phaethon americanus* Grant) at the Bermuda Islands. By Alfred O. Gross.

Contributions from the Bermuda Biological Station for Research No. 23. With nine plates. From the Auk, Vol. XXIX. No. 1, pp. 49-71.

This paper represents intensive studies of this species during two summers. It is as complete a life history as could be expected, with some interesting additions from the observations of those who live on these isolated islands. The accompanying pictures give a graphic account of the growth of the young and their development of feathers. We welcome it as another addition to the literature on life histories.

L. J.

Our Mid-Pacific Bird Reservation. By Henry W. Henshaw,
